

OSCAR RECOMMENDS

The OSCAR boiler industry recommends the installation of the following components that give to your heating system consistently high efficiency and minimize damages and wasteges.

A. NEUTRALIZERS

They neutralize acidic concentrates and protect the environment, controlling PH.

The neutralizers contain gels of calcium carbonate and magnesium hydroxide, and retain the dilute sulfuric acid solution containing the concentrates. They protect the hydraulic installation and the environment.

B. MAGNETIC FILTER

Protection against damages and wastes of the hydraulic circuit.

- The magnetic filter holds the metallic microparticles of the circuit protecting the various components of the circuit from damages and wastes.

C. MECHANICAL FILTER

- The installation of the mechanical filter on the heating circuit holds the non-conductive metallic particles of the circuit while keeping the heating water clean.

For solid particles that are not metallic.

The technical department of the **OSCAR** industry will gladly solve any questions you may have about the use and usefulness of all the proposed components.
